optparse Command Line Option Parsing

September 26, 2011

optparse is a command line option parser inspired by Python's "optparse" library. Use this with Rscript to write "#!"-shebang scripts that accept short and long flags/options, generate a usage statement, and set default values for options that are not specified on the command line.

In our working directory we have two example R scripts, named "example.Rscript" and "display_file.Rscript" illustrating the use of the optparse package.

bash\$ ls

display_file.Rscript
example.Rscript
optparse.Rnw
optparse.tex

In order for a *nix system to recognize a "#!"-shebang line you need to mark the file executable with the "chmod" command, it also helps to add the directory containing your Rscripts to your path:

bash\$ chmod ug+x display_file.Rscript example.Rscript
bash\$ export PATH=\$PATH:`pwd`

Here is what "example.Rscript" contains:

```
bash$ display_file.Rscript example.Rscript
#!/usr/bin/env Rscript
# Note: This example is a port of an example in the getopt package
         which is Copyright 2008 Allen Day
suppressPackageStartupMessages(library("optparse"))
# specify our desired options in a list
# by default OptionParser will add an help option equivalent to
# make_option(c("-h", "--help"), action="store_true", default=FALSE,
                help="Show this help message and exit")
option_list <- list(</pre>
    make_option(c("-v", "--verbose"), action="store_true", default=TRUE,
        help="Print extra output [default]"),
    make_option(c("-q", "--quietly"), action="store_false",
        dest="verbose", help="Print little output"),
    make_option(c("-c", "--count"), type="integer", default=5,
       help="Number of random normals to generate [default %default]",
        metavar="number"),
    make_option("--generator", default="rnorm",
        help = "Function to generate random deviates [default \"%default\"]"),
    make_option("--mean", default=0,
        help="Mean if generator == \"rnorm\" [default %default]"),
    make_option("--sd", default=1, metavar="standard deviation",
        help="Standard deviation if generator == \"rnorm\" [default %default]")
    )
# get command line options, if help option encountered print help and exit,
# otherwise if options not found on command line then set defaults,
opt <- parse_args(OptionParser(option_list=option_list))</pre>
# print some progress messages to stderr if "quietly" wasn't requested
if ( opt$verbose ) {
    write("writing some verbose output to standard error...\n", stderr())
# do some operations based on user input
if( opt$generator == "rnorm") {
    cat(paste(rnorm(opt$count, mean=opt$mean, sd=opt$sd), collapse="\n"))
    cat(paste(do.call(opt$generator, list(opt$count)), collapse="\n"))
cat("\n")
```

By default *optparse* will generate a help message if it encounters <code>--help</code> or <code>-h</code> on the command line. Note how <code>%default</code> in the example program was replaced by the actual default values in the help statement that <code>optparse</code> generated.

```
bash$ example.Rscript --help
usage: usage: example.Rscript [options]
options:
        -v, --verbose
                Print extra output [default]
        -q, --quietly
                Print little output
        -c NUMBER, --count=NUMBER
                Number of random normals to generate [default 5]
        --generator=GENERATOR
                Function to generate random deviates [default "rnorm"]
        --mean=MEAN
                Mean if generator == "rnorm" [default 0]
        --sd=STANDARD DEVIATION
                Standard deviation if generator == "rnorm" [default 1]
        -h, --help
                Show this help message and exit
```

If you specify default values when creating your ${\tt OptionParser}$ then optparse will use them as expected.

bash\$ example.Rscript

writing some verbose output to standard error...

- 1.22896371051081
- -0.435679893347483
- -0.226681340404723
- 0.742234438465059
- 0.376789881959823

Or you can specify your own values.

```
bash$ example.Rscript --mean=10 --sd=10 --count=3 writing some verbose output to standard error...

17.3512041284264
-4.5502949224453
17.2040586417878
```

If you remember from the example program that --quiet had action="store_false" and dest="verbose". This means that --quiet is a switch that turns the verbose option from its default value of TRUE to FALSE. Note how the verbose and quiet options store their value in the exact same variable.

```
bash$ example.Rscript --quiet -c 4 --generator="runif"
```

- 0.700658812653273
- 0.487605415750295
- 0.541121904505417
- 0.88158345175907

If you specify an illegal flag then *optparse* will throw an error.

```
bash$ example.Rscript --silent -m 5
```

```
Error in getopt(spec = spec, opt = args) : long flag "silent" is invalid
Calls: parse_args -> getopt
Execution halted
```

If you specify the same option multiple times then $\it optparse$ will use the value of the last option specified.

```
bash$ example.Rscript -c 100 -c 2 -c 1000 -c 7 writing some verbose output to standard error...
```

- 0.632035960225811
- 0.0199810360616797
- -1.16165669538515
- -0.189369728562984
- -1.02715719466663
- -1.53884277436787
- -0.0141700891550807

optparse can also recognize positional arguments if parse_args is given the option positional_arguments = TRUE. Below we give an example program display_file.Rscript, which is a program that prints out the contents of a single file (the required positional argument, not an optional argument) and which accepts the normal help option as well as an option to add line numbers to the output. Note that the positional arguments need to be placed after the optional arguments.

```
bash$ display_file.Rscript --help
usage: display_file.Rscript [options] file
options:
        -n, --add_numbers
                Print line number at the beginning of each line [default]
        -h, --help
                Show this help message and exit
bash$ display_file.Rscript --add_numbers display_file.Rscript
1 #!/usr/bin/env Rscript
2 suppressPackageStartupMessages(library("optparse"))
4 option_list <- list(</pre>
      make_option(c("-n", "--add_numbers"), action="store_true", default=FALSE,
          help="Print line number at the beginning of each line [default]")
6
7
8 parser <- OptionParser(usage = "%prog [options] file", option_list=option_list)</pre>
10 arguments <- parse_args(parser, positional_arguments = TRUE)
11 opt <- arguments$options
13 if(length(arguments$args) != 1) {
       cat("Incorrect number of required positional arguments\n\n")
15
       print_help(parser)
16
       stop()
17 } else {
18
       file <- arguments$args
19 }
20
21 if(file.access(file) == -1) {
       stop(sprintf("Specified file ( %s ) does not exist", file))
23 } else {
24
       file_text <- readLines(file)</pre>
25 }
26
27 if(opt$add_numbers) {
       cat(paste(1:length(file_text), file_text), sep = "\n")
29 } else {
30
       cat(file_text, sep = "\n")
31 }
bash$ display_file.Rscript non_existent_file.txt
Error: Specified file ( non_existent_file.txt ) does not exist
Execution halted
```

```
bash$ display_file.Rscript
Incorrect number of required positional arguments
usage: display_file.Rscript [options] file
options:
        -n, --add_numbers
                Print line number at the beginning of each line [default]
        -h, --help
                Show this help message and exit
```

Error:

Execution halted
